The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with activating peptide factors and malignancies, such as stimulating and activating peptide factors and malignancies, such as stimulating and activating peptide factors and malignancies, cytokines and activating peptide factors and malignancies, cytokines and centual and antibodies, antibody receptors, cytokine and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide creeptors, defensins, growth factors, vasoactive peptides and receptors, binding proteins and mallinancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconited pulmonary disease (COPD), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary transplantation rejection, pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infection, bundons, bronchitis, faragments and antisense oligonucleotides used in the exemplification of the present human polynucleotide Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -Disclosure; Page 1344; 1592pp; English. The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 13%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, and and along a clivities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and disease shoose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, pain, cystic ischaemic conditions, pulmonary vasoconstriction, allergies, pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, excitomary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomasy and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of decoyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA33313 to AAA35312 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEO ID No: 1 to 2815, and then the last invention. N. B. Sequences given in the disclosure of the present invention. N. B. Sequences given in the disclosure of the present invention. N. B. Sequences given in the disclosure of the present invention. No: sequences given in the disclosure of the present invention. No: sequences given in the disclosure of the present invention do not match up with their corresponding SEO ID NO: sequences given in the sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence encodes the human interleukin-15. The invention relates to entisense compounds that are targeted to a 5' or 3' untranslated region (5'UTR or 3'UTR) of a nucleic acid molecule encoding human interleukin-15 (IL-15), and inhibit the expression of human IL-15. The antisense

ö
inhibitors are is useful for inhibiting expression of IL-15 in human cells or tissues in vitro, for treating humans or other animals suspected of having or being prone to a disease associated with IL-15 expression, e.g. infections, inflammation or tumours. The inhibitors can also be used for research or diagnostic purposes. Using antisense compounds specifically and effectively inhibits IL-15 function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; bronchoconstriction; lung inflammatory; is bronchoconstriction; antinflammatory; immunosuppressive; antiasthmatic; analgasic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction, asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

C The present invention describes low adenosine (A) content antisense coligonuclectides and compositions (1) comprising them. In the antisense oligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinflammatory, analgesic, communosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with a ctivating peptide factors and transmitters, such as stimulating and immoglobulins and antibodies, antibody receptors, cytokines and chemokines, adhesion molecules and their receptors, cytokine and binding proteins, adhesion molecules and their receptors, central receptors, adhosion molecules and their receptors, central receptors, adhosion molecules and non-nervous system (CNS) and peripheral nervous and non-nervous system creeptors, defensins, growth factors, vasoactive peptides and entisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, condition selected from pulmonary vasoconstriction, inflammation, condition selected from pulmonary vasoconstriction, inflammation, hypotensial conditions especially pulmonary disease or conditions especially pulmonary disease or conditions especially including respiratory obstruction respiratory distress syndrome (CNS); pain, cystic fibrosis (CF), allergic rhinitis (ANS), pulmonary company transplantation rejection, pulmonary pulmonary transplantation rejection, pulmonary including profice and/or surfactant profice and/or surfactions, bulmonary pulmonary including respiratory obstructive pulmonary including respiratory or and/or surfactant profice and/or surfactant profice and/or surfactant profice and/or pulmonary pulmonary disease or hypertension, emphysema, chronic o

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Disclosure; Page 1260~1264; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which carrayers nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiliflammatory, antiallergic, cuseful for the treatment of diseases associated with inflammation. Cuseful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating effects afflict the lungs of a subject. They can be used for treating est, including lung disease and diseases whose secondary confinence conditions, pulmonary hypertension, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive asthma, impeded respiration, respiratory distress syndrome, pain, cystic intromary disease (COBD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including the onlinency disease (COBD), and cancers such as leukaemias, lymphomas, breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the bronchoconstriction and inflammation. AAA33313 to AAA3532 represent the invention, which correspond to SEQ ID No:1 to 185, but the sequences are also called SEQ ID No:1 to 185, but the sequences (AAA32331 to AAA3332) to AAA3332 to the previously named sequences. SEQ ID No:1 to 1680 invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID No: sequences invention the sequence listing.

The present sequence is human interleukin-15 (IL-15) gene allele located on chromosome 4q31. The polymorphic variants of IL-15 genes are useful for the expression and function of IL-15 genes are useful for screening for candidate drugs to IL-15 protein for use in useful for screening for candidate drugs to treat diseases related to IL-15 polymorphic sites are useful for studying control of the protein diversity anthropological lineage, the significance of individual at the novel IL-15 polymorphic sites are useful for studying population diversity and hineage of the phenotypic level, paternity testing, control of disease. Identifying associations between IL-15 for energic applications and for identifying association between a genotype corresponse and a trait, is useful for develophing diagnostic tests and therapeutic treatments for infections, human immunodeficiency virus and therapeutic treatments for infections, human immunodeficiency virus and therapeutic treatments for infections, human immunodeficiency virus and therapeutic presponse and a genotype or haplotype or

The present sequence is human interleukin-15 (IL-15) gene located on chromosome 4931. The polymorphic variants of IL-15 genes are useful for studying the expression and function of IL-15 and expressing to IL-15 protein for use in useful for screening for candidate drugs to IL-15 protein for use in useful for screening for candidate drugs to individual at the novel IL-15 polymorphic sites are useful for studying condition diversity, anthropological lineage, the significance of diversity and lineage of the phenotypic level, paternity testing, forensity and lineage of the phenotypic level, paternity testing, for response or consideration and a trait such as level of drug response or susceptibility to disease. Identifying an association between a genotype or haplotype and a trait, is useful for developing diagnostic tests and therapeutic treatments for infections, human immunodeficiency virus and trait creatments for infections, human immunodeficiency virus and conspiculation and approtype or haplotype (or haplotype pair) for the IL-15 gene may be the basis for designing a diagnostic method to determine those individuals who will or will not respond to the treatment, or treatment, it is a lower level and thus may require more treatment it is a lower level and thus may require more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             treatment, 1.e. a greater does of a drug. The genotyping or haplotyping methods are also useful for developing drugs targetting IL-15. The genotyping and haplotyping methods are also useful for developing drugs targetting IL-15. The trials. IL-15 DNA is useful for therapeutic purposes for treating disorders affected by expression of function of novel IL-15 isogene and also in gene therapy. Expression of an IL-15 isogene and by transforming a targetted organ, tissue or cell population of an expression vector that expresses high levels of untranslatable mRNA for
                                                                                                                                                                                            Novel polynucleotides comprising one of 11, PS1-PS11, single nucleotide polymorphisms in human interleukin-15 gene, and useful for treating disorders affected by expression of function of interleukin-15 isogene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CCCAGTTGCAAAGTAACAGCAATGAAGTGCTTTCTCTTTGGAGTTACAAGTTATTTCACTT 300

A simian species of IL-15 (sIL-15) was purified and analysed by SDS-
DAGE. Bioassay of unstained gel slices indicated IL-15 activity was
assoc. with proteins having mol. wts in the range of 15-17 kba. The
assoc. with proteins having mol. wts in the range of 15-17 kba. The
Identity of the II-17 kba was sequenced. The results indicated the
identity of the II-17 kba was sequenced. The results indicated the
identity of the II-17 kba was sequenced. The results indicated the
connected and amature polypeptide Aar83309. Subsequent sequence encoding
the polypeptide Aar83436. Aar83436 comprises a relatively short 48 AA
leader sequence and amature polypeptide Aar83309. The sequence of the
N-terminal 31 AAs of AAR83309 was used to design one primer, a
for the amplification of IL-15-specific DNA sequences. The first
degenerate mixture coding for all possible codon usages - AAT00528.
The AA sequences of the simian mature N-terminus 26-31 were used
to design a second primer, a degenerate mixture coding for a
complement of all possible codon usages of AAS 26-31, omitting
posn. 3 of Val (AAT00529, AAT00530). Polyadenylated RNAs from CV-1/EBNA
cells were used as templates. A 92 bp DNA fragment was used as a
hybridisn. probe to screen a portion of a plasmid library contg.
CDNA inserts prepd from CV-1/EBNA polyadenylated RNA. This
cented in the isolation of clone C85.sIL-15 that has an ORF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cDNA generated from PMA-stimulated CV-1/EBNA cells was amplified by PCR using primers based on the N-terminal sequence of simian interleukin-15 (sIL-15). A probe based on an isolated clone was ut coscreen a plasmid library containing cDNA inserts prepared from CV-1/EBNA poly-A RNA. Clone C85.sIL-15 was isolated that has the ORF given in AAQ84583.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New purified interleukin-15 - which induces \tau cell proliferation and differentiation, used for the treatment of tumours and viral

New epithelium derived T cell factor - induces proliferation of T and B cells, stimulates destruction of tumour and virus-infected cells and protects against toxicity, partic. for treating intestinal disease and HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human ETF (epithelium derived T cell factor) cDNA was isolated by screening a IMTLH cell cDNA library with a simian ETF probe. The IMTLH cell line was derived from a stable transformation of a human bone marrow stromal cell culture with pSV3Neo. Mature hETF induces proliferation and/or differentiation of precursor or mature T cells and is useful for promoting long-term in vitro culture of T-lymphocytes and T-cell lines. It is used for treating gastrointestinal diseases including peptic ulcer, colltis and

This is the nucleotide sequence encoding a simian epithelium-derived
T-cell factor (ETF). The protein was purified from African green monkey
CV-1 kidney cells in culture by conventional chromatography: hydrophobic,
CV-1 kidney cells in culture by conventional chromatography: hydrophobic,
anion exchange and reverse phase HPLC, followed by separation by
SDS-PAGE. The proteins from the SDS-PAGE were transferred to a PUPF
nembrane and the band corresp. to ETF was cut out for peptide sequencing.
Primers were synthesised based on this sequence and used to amplify a
Proliferate by phorbol 12-myristate 13-acctate. The 92 bp fragment was
proliferate by phorbol 12-myristate 13-acctate. The 92 bp fragment was
this sequence. ETF is a protein of 15-17 kD which is expressed by
epithelial cells and stimulates proliferation and/or differentiation of
promoting long term in vivo culture of T-lymphocytes and T-cell lines.
                                                                                                        Epithelium-derived T-cell factor; simian; human; culture; proliferation; epithelial cell; differentiation; T-lymphocyte; African green monkey; primer; PCR; polymerase chain reaction; amplification; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated simian and human epithelium-derived T-cell factors which stimulate the proliferation and/or differentiation of T-lymphocytes and T-cell lines

Muteins of simian IL-15 or human IL-15 (see also AAR98527) are useful as antagonists of IL-15 and can be preped. by PCR-mediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Asp56 and/or Gln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host disease and for prolonging allograft survival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

```
This sequence encodes a human epithelium-derived T-cell factor (ETF) which is used in a method for treating or preventing gastrointestinal disease. These polypeptides have particular applitation in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy- and radiation-therapy induced entertits (gut toxicity) mucositis, peptic ulcer disease, gastroenteritis and collitis, villus atrophic disorders, malignancy and inflammatory bowel disease. ETF polypeptides may also be useful in the treatment of human immunodeficiency virus (HIV) and HIV associated disease due to their abillity to stimulate CDA+ and CDB+ cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.
Treatment or prevention of gastrointestinal diseases – by administering epithelium-derived T-cell factor polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 489 BP; 162 A; 81 C; 92 G; 154 T; 0 other;

The invention relates to an isolated antibody that binds specifically to a simian or human epithelium-derived T-cell factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunoassays. They may also be used as diagnostic and therapeutic agents, e.g. when conjugated to toxins (or their precursors) or radionaclides. ETF induces proliferation and/or differentiation of T cells (or their precursors), e.g. for use in establishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. entertitis or mucositis induced by chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, chuman immune deficiency virus infection or associated disease, or generally in any situation requiring stimulation of T or B cell corressed anti-infectious disease immunity, induction of T-cell lytic

   destruction of tumour or virus-infected cells. The ssents a DNA encoding a human ETF precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents the simian interleukin 15 (IL-15) nucleotide sequence. The IL-15 nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-15. An antagonist of IL-15 can be used for treating an inflammatory bowel disease (IBD). The invention relates to the treatment of celiac disease using IL-15 antibodies antagonists. The antagonists are preferably muteins of IL-15, antibodies against IL-15 or IL-15 molecules bound to chemical groups that interfere with the ability of IL-15 to effect a signal transduction through either the alpha or the gamma subunit of the IL-15 receptor complex. The IL-15 antagonists of the Invention can be used to treat irritable bow disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of antagonists of interleukin-15 for treating an inflammatory bowel disease, particularly celiac disease

stimulates precursor or mature CD4+ and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes proliferation of the gastrointestinal epithelium. The protein can be used to promote long-term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it could be used to augment the destruction of tumour cells or virally. Infected cells. ETF may also be used to treat or prevent gastrointestinal disease, including chemotherapy and radiotherapy associated enteritis, disease, including chemotherapy and radiotherapy associated enteritis, collitis, inflammatory bowel disease and villus atrophic disorders. Chemotherapy and radiotherapy associated enteritis (gut toxicity) results in bleeding and sepsis due to gastrointestinal flora checity results in bleeding and sepsis due to gastrointestinal flora diministered to a cancer patient. ETF may therefore be used to increase the tolearted doses radiotherapy and chemotherapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         qq
                                                                                                                                                                                              The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel disease, for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal coxity; and for treating HIV and HIV-associated diseases. The coxitity and for treating HIV and HIV-associated diseases. The conditions where it is desired to stimulate proliferation of rasease or conditions where it is desired to stimulate proliferation of immunoglobulin B lymphocytes, or the secretion of immunoglobulin B lymbocytes, or to sugment anti-infectious diseases immunity, to induce CTL, LAK or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a CDNA encoding the human ETF (hETF) polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ó

A simian species of IL-15 (sIL-15) was purified and analysed by SDS-
PAGE. Bioassay of unstained gel slices indicated IL-15 activity was
assoc. with proteins having mol. wits in the range of 15-17 kDa. The
assoc. with proteins having mol. wits in the range of 15-17 kDa. The
cassoc. with proteins having mol. wits in the range of 15-17 kDa. The
identity of the first 33 ABs of ARR83309. Subsequent sequencing of a
cDNA clone obtd. from a simian library provided a sequence encoding
the polypeptide AAR83436 AAR83309. Subsequent encoding
cC con the polypeptide AAR83430 was used to design synthetic PCR primers
CC for the amplification of IL-15-specific DNA sequences. The first
degenerate mixture coding for all possible codon usages - AAT00528.
CC AAS of the N-terminus were used to design one primer, a
degenerate mixture coding for all possible codon usages - AAT00528.
CC The AA sequences of the simian mature N-terminus 26-31 were used
CC codesign a second primer, a degenerate mixture coding for a
complement of all possible codon usages of AAS 26-31, omitting
posn. 3 of val (AAT00529, AAT00530). Polyadenylated RNAs from CV-1/EBNA
CC cells were used as templates. A 92 bp DNA fragment was used as a
hybriddisn. probe to screen a portion of a plasmid library contg.
CC resulted in the isolation of clone C85.sIL-15 that has an ORF
CC given in AAT00524. AAR83309 is the active polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      q
                                                                                                                                                                                                                                                                                                                                                              The invention relates to simian and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enterties and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The antibodies are further used to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B imphocytes, to augment anti-infectious disease immunity, to induce CTL, in a NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a cDNA cenceding the human ETF (HETF) mature polypeptide.

The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is affilicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New peptide useful as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

```
The invention relates to human breast cancer expressed polynucleotides (AALO/544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                              New peptide useful as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                   5.9%; Score 29; DB 22; Length 474;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleic acids, targeted to interleukin-15 (IL-15). The products of the invention have anti-IL15, anti-inflammatory, hepatotropic, anti-arthritic, neuroprotective, antipoliferative and antiulcer activity and can be used for gene therapy. The antisense oligonucleotides are used to inhibit interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases include inflammatory disorders, such as inflammatory bowel disease,
                                                                   The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 to
as
 as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes novel antisense oligonucleotides of 8-40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense oligonuclectides targeted to interleukin-15 used treat inflammatory diseases and cell proliferative diseases such inflammatory bowel disease and chronic liver disease -
                                                                                                                                                                                                                                                                                                                                                               0;
                                                                                                                                                                                                                                                                                                                         Length 506,
                                                                                                                                                                                                                                                                                                                                                             Indels

This invention describes novel antisense oligonucleotides of 8-40 nucleic acids, targeted to interleukin-15 (IL-15). The products of the nucleic acids, targeted to interleukin-15 (IL-15). The products of the invention have anti-III5, anti-Inflammatory, hepatotropic.

In an oan be used for gene therapy. The antisense oligonucleotides are used to inhibit interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases include inflammatory disorders, such as inflammatory bowel disease.

Include inflammatory disorders, such as inflammatory bowel disease, archifus, cirrhosis, multiple sclerosis, chronic liver diseases, ulcerative colitis and cell proliferative disorders. The treatment may be in vivo or ex vivo. The antisense oligonucleotides of the invention expecific for interleukin-15 (IL-15), and can be delivered expensed in the antisense ligonucleotides disclosed in the method of the
                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           IL-15; interleukin 15; human; anti-IL15; anti-inflammatory; hepatotropic; anti-arthritic; neuroprotective; antiproliferative; antiulcer; antisense; gene therapy; macrophage; inflammatory disorder; bowel disease; primer; arthritis; cirrhosis; multiple sclerosis; chronic liver disease; ulcerative collitis; cell proliferative disorder; treatment; ss.
arthritis, cirrhosis, multiple sclerosis, chronic liver disease, ulcerative colitis and cell proliferative disorders. The treatment may be in vivo or ex vivo. The antisense oligonucleotides of the invention are specific for interleukin-15 (LL-15), and can be delivered exogenously or can be expressed from DNA or RNA vectors. AAZ88709-Z88723 represent the antisense ligonucleotides disclosed in the method of the
